COMPUTER SCIENCE DEPARTMENT

TEST 2

INSTRUCTIONS

1. ANSWER ALL QUESTIONS
2. ANY REFERENCE MATERIAL IS NOT PERMITTED

DURATION 1HR.

1. A cybersecurity _____ is a comprehensive evaluation of an organization's cybersecurity undertaken to identify any vulnerabilities or risks that could compromise the integrity of the organization's data and systems.

2. Cybersecurity Audit Checklist provides a comprehensive list of items that should be checked out during a security audit, and they include the following but not

Data Security, Network Security, Application Security

Data Security, Network Security, User Security, Management Security

Data Security, Network Security, Application Security, User Security

Data Security, Network Security, Application Security, Device Security

3. Match the followging sentences/words to a correct one, involving the benefits of a cybersecurity audit

Measures Shortcomings Threats Performance Partners Vulnerabilities

Identifying and Fixing	✓

Comprehensive Evaluation of Internal and External Security	✓
Uncovering __ in Your Security Defenses	✓
Keeping Up with the Latest	✓
Providing Peace of Mind to Staff, Customers, and	✓
Improving Overall Technology and Security	✓

.

4. The audit process typically includes a review of the organization’s: (Choose the best answer)

network architecture, software, users and incident response plan.

network architecture, software and hardware configurations, access controls, and incident response plan.

network architecture, software and hardware configurations, access controls and users

network architecture, hardware configurations, access controls, users and incident response plan.

5. Tests, Assessments and Audits are the three different methods to evaluate the performance, compliance and cybersecurity of an organization. State what each of the following is:

	Assessments	Audits	Test
_ is a specific and focused evaluation that is intended to measure the performance of a specific aspect of the cyber system or process, evaluating the performance of a system or a process by using a set of predefined criteria. Valuating the performance of a system or a process by using a set of predefined criteria			✓
_ provides an overall understanding of the business' cybersecurity performance, compliance, and to identify any areas that may require improvement, by evaluating multiple aspects of an organization, such as its security posture, compliance status, or overall performance.		✓	
_ is an independent and systematic examination of an organization's cybersecurity performance and compliance intended to assure stakeholders such as management, shareholders, customers, and regulators, that the organization is operating effectively and efficiently.			

6. Cybersecurity audit involves performing various vulnerability scans to gain unauthorized access to the systems, applications, and networks. What statement is used to describe the above activity. _____

7. Database watermarking involves aspects of data hashing and digital watermarking, to data stored in a file. What does watermarking ensures.

8. The following applies in copyright Protection, regulations and compliance. Tick the best choice for each *

	Copy	Moral
_ rights grant the author the right to keep his name on the work forever and protect him from any distortion or alteration of the work or other offensive action in relation to the work		✓
_ rights always protects the creator, either fully or partially, even after the assignment of right to work to others		✓

9. Tick whether true of false:

Copyright protection is provided for

	true	false

Works not fixed in tangible form	✓
Works fixed in tangible form	
Ideas, concepts, procedures, process and plans	
Works that are not in the public domain	✓
Original authorship is not traceable	

10. Database __ is the process of converting data, within a database, in plain text format into a meaningless cipher text by means of a suitable algorithm.

11. What process do we call , where the client has to establish the identity of the server and the server has to establish the identity of the client, and this is done often by means of shared key.

Access authorization

Access Authentication

Access controls

Access encryption

12. What term is used to describe where an attacker targets a high-profile business executive or manager with more critical information to lose, using emails and web pages which serve the scam to appear as official.

Phishing

Whaling

Vishing

Smishingn
