LEARN TO INNOVATE

GROUP 1 MEMBERS

QUESTION

- Profiling the attacker from script-kiddies to state-sponsored groups.

Introduction

- Attacker profiling helps organisations understand who is attacking, why they attack, and how sophisticated they are.
- Attackers range from low level to highly organised and government groups.

Attacker Profiling

- Attacker profiling is the process of identifying and analysing the type of attackers, their skills, motives, resources and behaviour in order to understand how and why an attack is carried out, so that better security and response decisions can be made.

Script Kiddies

- Script Kiddies are unskilled or novice individuals who engage in hacking activities using pre-written software, tools, and scripts developed by others, without understanding the underlying mechanics or code. The term itself often shortened to "skiddies“ is generally derogatory, implying a lack of expertise, creativity, or original skill.

Key Characteristics

- Low skill level, they rely on existing tools/scripts
- Motives: curiosity, bragging rights, causing trouble
- Targets: often random, opportunistic attacks
- Techniques: use pre-made malware, exploit kits.

Hacktivists

- They are politically or socially motivated
- They target specific causes or motivations.
- Skills: moderate to high, use known exploits
- Examples: anonymous, legion of the chedah (LotC).

Cyber Criminals

- Financial gain, steal data, ransomware
- they are skilled, organized, often work in groups
- Targets: businesses, individuals with valuable data
- Techniques: phishing, malware, exploit kits

Insider Attackers

- Are legitimate users such as employee or students.
- Already have authorized access to systems.
- May abuse privileges for personal benefit or revenge.
- very dangerous because they bypass many security controls.

State Sponsored Groups

- Supported or funded by national government
- Have advanced tools, infrastructure and expert teams.
- Target government systems, critical infrastructure and research institutions.
- Motivation is national security, political influence and intelligence gathering

CONCLUSION

- Attackers differ in skill, resources and motivation.
- Understanding attacker profiles helps organisations design better security and response strategies.
- The level threat increases significantly from script kiddies to state sponsored groups.
